Technical AI fails when language becomes calculation

NuclidePath makes the responsibility boundary explicit and testable.

01 · The failure mode

A general-purpose LLM can invent parameters, equations, units or reassuring conclusions — all unacceptable in emergency-analysis workflows.

02 · The boundary

The model returns only a six-step allow-listed plan. Strict schemas feed deterministic physics, retrieval and uncertainty tools.

03 · The outcome

Every value is versioned, reproducible and tied to inputs, assumptions, sources, warnings and SHA-256 artifacts.

PLAN

TOOLS

EVIDENCE

A private workflow with an immutable physics boundary

The AMD-local model plans. Five deterministic subsystems execute and report.

All five private-agent capabilities are implemented

Each capability is exercised in the same end-to-end run and covered by tests.

01 Local retrieval

Ranked excerpts, local paths, source URLs and transparent scores.

VERIFIED

02 Tool invocation

Environment Agent calls a strict, versioned JSON physics contract.

VERIFIED

03 Multi-step planning

Deterministic fallback or Qwen3.5-9B returns six safe steps.

VERIFIED

04 Multi-turn memory

Session JSONL stays local, mode 0600, with explicit deletion.

VERIFIED

05 Permissions + privacy

Role allowlist, recursive redaction and denied operational actions.

VERIFIED

5/5

capability flags true

**One workflow. One
privacy boundary. No
cloud dependency.**

The LLM never calculates transport

Model 0.3 declares PDE, source and boundaries, then uses a verified analytical solution.

$$R \frac{\partial C}{\partial t} = D \frac{\partial^2 C}{\partial x^2} - v \frac{\partial C}{\partial x} - \lambda RC$$

$$C(x, 0) = 0 \quad \cdot \quad C(0, t) = C_0 \quad \cdot \quad C(\infty, t) = 0$$

$$A = \sqrt{v^2 + 4\lambda RD}$$

$$C/C_0 = \frac{1}{2} \left[\exp((v-A)x/2D) \operatorname{erfc}(z_-) + \exp((v+A)x/2D) \operatorname{erfc}(z_+) \right]$$

REACTIVE OGATA-BANKS

231

AMD core snapshot

0

LLM physics values

Independent analytical cases

Ogata-Banks limit · source boundary · reactive steady state · finite rejection

Explicit limitation

Constant-source 1-D screening — not a dose code, regulatory model or calibrated site prediction.

Multicomponent bridge (opt-in)

GCS K/Na competition + NH₄ on FES; extended K/Na/Ca/Mg path is process-qualified, not promoted.

Traceable post-merge science

The latest work adds deterministic, auditable layers around the canonical screening path.

388/2

AMD post-merge tests

4

ions · K/Na/Ca/Mg

2×

fixtures · brine/recharge

0

unqualified claims

PHREEQC bridge

Opt-in scenario compiler: declared water chemistry, CEC and Cs + K/Na/Ca/Mg into SOLUTION/EXCHANGE/TRANSPORT input

Arithmetic oracle

Independent machine-readable checks for units, grid mapping, non-negativity and exchange-site occupancy

Calibration gate

Dependency-free traceable Cs calibration/hold-out contract with fail-closed promotion; no data bundled

Benchmark registry

Separate EPA/Fuller/Dubus external Cs registry with source digests and calibration_eligible: false

PROCESS-QUALIFIED ONLY

Canonical transport-prototype-0.3 remains authoritative; the bridge is opt-in and does not replace it.

Qwen3.5-9B Q8 runs locally on Radeon + ROCm
